

The Rise And Reign Of Quonset Huts

Quonset hut simply refers to semi cylindrical structures of lightweight metal. The most common form of Quonset Hut is made from iron or stainless steel which is covered with a relatively less reactive metal to protect iron from getting converted into rust which is further bent to give a semicircular shape. The first Quonset Hut was first produced in a small village in the Rhode Island called Davisville at specific location called Quonset Point. Steel gives robustness and flexibility to these structures. In some cases the use of punched or holed sheets was found to decrease weight and increase malleability. Lately Quonset Hut producers have used PVC and quite successfully so because of the low maintenance cost.

As it is said that necessity is the mother of all inventions, the need of such a multipurpose and durable structure was felt during the Second World War by the USA naval forces. The advantages were many including mobility and easy construction. To add on to the quality of hassle free erection it could be put to any use since it absolutely resisted any austerity of weather including rains, hail, snowfall etc. Soon this product became popular with the common masses and was immediately accepted and put to various uses like running a warehouse, garage, hangar, retail stores, inventories etc. Another factor responsible for the popularity of Quonset Huts is its economic viability, that is to say they are comparatively low priced when weighed against their traditional counterparts like concrete etc. Due to the size of the structure it is first manufactured in parts in the factory and later transported to the place where it is required to be put together. However, it may be noted that these metallic structures do not offer much customization over the basic design if one wishes to plant windows etc. Since they do not need skilled assistance for assembly, they can be assembled by the purchasers also. Depending upon the precise requirement of the purchaser, some manufacturers also provide customization option but not with complete freedom to alter the structure.

The concept of demand and supply has now crowded the market with large number of enthusiastic merchants of the Quonset Huts. In agriculture oriented economies, these are widely acclaimed since they can be easily erected in farms and put to various uses from protection of crops to harboring of livestock etc. In the modern times this might also emerge as a major housing solution since it is comparatively economical and gives a decent floor area of about 720 meters square to 1200 meters square. Markets are also not devoid of players who offer to provide fancy partition inside them to grow separate rooms etc. It can be safely concluded that metal structures have to go far ahead in their journey of fame and popularity with the masses.
