

A basic overview of Tetra Bio Bags

Recently, non degradable plastics have been gaining much public ire and the call to shift to bio degradable bags is increasing every day. Also, in any packaging the golden triangle of health, pleasure and convenience must be adhered to as it is the current trend amongst the youth of the world. Tetra bio bags, made by TetraPak has been making bags since nineteen hundred and fifty three (1953) and have since made many changes to packages not to mention addition and growth.

Let us consider the history of how tetra bio bags came to be. The tetra classic packaging was launched in nineteen fifty three by the founder Ruben Rausing, who had been working on it since nineteen forty three (1943). Using a system of plastic and aluminum coated paperboard combined with an aseptic filling system, these cartons had the ability to be perfectly airtight. These initial cartons were tetrahedra, leading to the company's name: TetraPak, derived from "four" in the Greek language. Another one called the TetraBrik was introduced in nineteen sixty three (1963), which was a rectangular cuboid carton. Tetrawedge which was wedge shaped packaging and tetraprisma which was a round octagonal packaging along with tetrafino which was a pouch shaped packaging were other cartons that were launched. TetraPak also produced other non aseptic packaging systems ... including tetrarex (gable top), tetratop (paper and plastic molded in one) and the now discontinued tetraking, these are some other tetra bio bags. Recently, tetra bio bags have been introduced for vegetables opposing the tin culture. This new tetra bio bags, called tetrarecart are laminated paper boxes and allow for more subtle reprocessing of vegetables than canning permits. Even wineries are using these cartons for selling wines in five hundred milliliters and one liter Tetraprisma Aseptic packages with re closable screw caps. Although unsuited for long term storage or aging of wines, the tetra bio bags save weight and space and eliminate the concerns of glass bottle disposal, saving consumers money.

Tetra bio bags or tetra pack is after all a business and like any sound business it is responsible and it evolves. A hundred percent traceability in wood fibers in its paperboard from suppliers in Europe and south America has been achieved by tetra pack who make the tetra bio bags. The cartons also have a minimal environmental footprint and this is significant in world that is going green. Transportation is easier as these bags take up less space and are lighter than glass.

The growth in the use tetra [bio bags](#) is expected to be even more as the consumption of milk and other packages liquids is going up steadily with the emergence of more economies and more additions to the middle class of the world. Today, the packaging itself almost acts as the salesman and does the job of attracting the consumers interest. Many countries use tetra bio bags today from Sweden to China to India.
