

Prefabricated Metal Buildings Solve Your Storage Problems With Ease

You should give prefabricated metal buildings a look if you are considering an expansion of your workshop or storage space. Prefabricated metal buildings are versatile, easily assembled, affordable and constructed from materials strong enough to withstand the harshest weather conditions. S series prefabricated metal buildings work wonderfully as large workshops or garages. With its high sidewalls, rounded roof and beamless support as its major selling points, you can understand how popular this design is for garages, workshops and storage buildings. S series prefabricated metal building kits come large enough to house an RV or boat or an 18 wheeler, if you drive truck for a living. Fire departments even use them for their fire stations. Commercial and industrial shop owners like the design for its capacity to house small industrial and manufacturing operations. Check out the P series of prefabricated metal buildings if you are looking for smaller, more personal space. This design gives you high sidewalls and arched roof ideal for use as a garage or backyard workshop and can be customized to match the outside of your home. Some people even use them as guest cottages, believe it or not. Similar to the P series, the A series of prefabricated metal buildings sports a roof having a 4 to 12 pitch that resists heavy snow buildup.

Then, there is the Q series prefabricated metal building that is modeled after the Quonset huts that were used during World War II. Quonset huts were originally developed to house troops and equipment in the field and proved so popular that returning servicemen purchased the surplus huts for their post war housing. Universities also purchased some of the surplus for overflow student housing.

Prefabricated metal buildings are not hard to assemble. Each kit comes with an easy to read manual of step by step instructions for construction of your prefabricated metal building in a matter of days. Laying the foundation is the longest step in the process. Once your concrete floor or concrete beam supports are in place, the rest is a matter of putting together the beams, rafters and metal sides and roof and customizing your building with doors, windows, wiring and insulation.
