

Wax your car

Waxing your car is as important as cleaning it. A properly applied [car wax](#) not only provides a glossy look but also prevents peeling off the original paint and offers resistance against minor scratches and stains. The very first step before applying a wax coating is to wash your vehicle thoroughly. There are a multiple of reasons to park your car away from the extreme weather because direct sunrays and a strong current of wind will wipe off the layers of applied wax before you could even relish the results.

The Steps

Just take a small amount of wax on a damp sponge and apply it in circles. Repeat the process often and remember where you originally started from? Be careful when applying wax near the joints of car doors and hood as the accumulating wax can harm the levers. After waxing the entire vehicle in patches, take a soft cloth to start cleaning the wax from the initial start point. While cleaning, you will notice that the wax will gradually build up on the cleaning cloth. Dont forget to shake off the wax, regularly. After cleaning, take a closer look and you might notice very small round stains. You must get rid of the remaining residual wax. The final step is to clean the entire vehicle with another soft cloth before enjoying that exhibition type look.
