

## And All in Metal Buildings

Who would have guessed that you could have an entire adventure that takes place in metal buildings? We were at an amusement park and a surprising number of rides and special effects features were set up in metal buildings. We stood in line outside one of these buildings in the sunny daylight, and when we finally entered the ride, we forgot about the outside world. The movie E.T. was the theme of this ride. To take the ride, we sat on these bikes that looked just like the ones Elliot and E.T. rode off into the moonlight on in the movie. Unlike Elliot, the ride moved our bicycles along, so it required no pedal power on our part. As soon as we entered the first of the series of metal buildings, it was dark and we were enveloped in a forest. It felt like a Fall night and the smell of pine trees enveloped us. We could see stars too. Our bikes zoomed us through the woods, over the town and passed the gigantic full moon. We felt like we were in the movie. An incredible adventure in a series of metal buildings.

Metal buildings are quite common in adventure parks across the country, and you can see why. I could enlist the help of a few of my friends and put together a metal building with basic tools. Companies that sell such buildings include a manual and a set of floorplans. You can pour the concrete footing before your building arrives, so you will be ready to put the thing together. The buildings can be assembled on the ground. You raise the basic structure, and secure it to the foundation. The other pieces can be added once that is done and your building is then finished. It all just takes less than a week and a few good friends to help out.

Metal buildings have a leg up on traditional structures beyond the fact that they are easy to build. They are a lot cheaper to build than traditional buildings. The design of most metal buildings offers a very efficient use of space; there is little space inside that cannot be used. You do not have to worry about maintaining the roof, cleaning gutters or painting the structure. No traditional building could weather hurricanes, hail, water and flames like metal buildings can. All parts of metal buildings can be used again or recycled and their construction does not involve any wood, so you can pat yourself on the back by saving some trees. Metal is also impervious to carpenter ants, bees and termites.

If Universal Studios can house and run an entire E.T. adventure ride in metal buildings, you can only imagine the uses for such structures in everyday life. Auto shops, boat yards, airports, and warehouses are some of the commercial business that use metal buildings. Residentially, they are used for garages and workshops. With the time and money you save building and maintaining a metal structure, you can spend a lot more time exploring amusement parks.
